OUTHHAUL BOOM SECURING

Have you ever tried re-attaching your outhaul control line to the boom out on the water, its damn near impossible especially if there is any wind?

To ensure your outhaul never comes undone from that small plastic V on the end of your boom. Drill a small hole in the bottom or the back face of the black plastic end piece and thread the outhaul through it, and secure with a figure of 8. Simple but very effective, it will never drop out again.

Original V that is 'supposed' to work with a stopper knot...This can easily jump out of the V fitting just when you don't want it too.

Solution...Drill a 5mm hole here in the bottom of the fitting or here through the end face, pass the line through and tie a stopper knot...it won't come back through now!!!!
